Research Summary

Imaging flow cytometry is an advanced analytical technique that combines the capabilities of traditional flow cytometry with high-resolution imaging. This method allows the simultaneous analysis of multiple physical and chemical characteristics of thousands of individual cells in a fluid stream. Imaging flow cytometers capture detailed images of each cell, providing spatial information alongside standard flow cytometry data. By integrating fluorescence microscopy and flow cytometry, this technique enables researchers to analyze cellular morphology, internal structures, and fluorescence signals simultaneously. Imaging flow cytometry is valuable in various fields, including immunology, cancer research, and drug discovery, offering a powerful tool for studying cellular processes at both the population and single-cell levels.

The major global manufacturers of Imaging Flow Cytometry include Luminex Corporation, Sysmex, etc. The global players competition landscape in this report is divided into three tiers.
