Research Summary

An implant abutment is a crucial component in dental implantology, serving as an intermediary piece between a dental implant and a prosthetic restoration such as a crown, bridge, or denture. The abutment is typically attached to the implant fixture, which is surgically placed in the jawbone to replace a missing tooth root. Implant abutments come in various shapes and materials, allowing for customization based on the specific clinical and esthetic requirements of the patient. They play a pivotal role in connecting the implant to the visible prosthetic tooth, providing stability and support. The choice of implant abutment can influence the final aesthetic outcome, the ease of maintenance, and the overall success of the dental implant restoration. Abutments may be prefabricated or custom-made, and they are an integral part of the comprehensive treatment approach in implant dentistry, contributing to the functionality and natural appearance of the final dental restoration.
