### Research Summary

An implantable intravenous infusion port, commonly known as a port or portacath, is a medical device used for long-term administration of intravenous (IV) treatments. Surgically implanted beneath the skin, usually in the chest area, the port consists of a reservoir or chamber connected to a catheter that is threaded into a large vein. The port allows healthcare professionals to access the vascular system for the infusion of medications, chemotherapy drugs, or other fluids without the need for repeated needle sticks. The device is accessed using a special non-coring needle that punctures the port's silicone septum, providing a secure and convenient entry point for administering treatments. Implantable intravenous infusion ports are particularly beneficial for patients requiring frequent or prolonged IV therapy, as they minimize the discomfort associated with repeated peripheral vein access and reduce the risk of complications.
