Research Summary

In-vitro colorectal cancer screening tests are diagnostic assays conducted outside the body to detect the presence of colorectal cancer or precancerous conditions. These tests involve the analysis of biological samples such as stool or blood to identify specific markers associated with colorectal abnormalities. Examples of in-vitro colorectal cancer screening tests include fecal occult blood tests (FOBT), which detect hidden blood in the stool, and molecular tests that assess genetic or protein markers indicative of colorectal cancer. These non-invasive screening methods play a crucial role in early cancer detection, allowing for timely intervention and improved outcomes. In-vitro colorectal cancer screening tests are valuable tools for population-based screening programs and are recommended as part of routine healthcare to detect and prevent colorectal cancer, one of the leading causes of cancer-related mortality globally.

The major global suppliers of In-Vitro Colorectal Cancer Screening Tests include Alere(Abbott), Beckman Coulter, Siemens Healthcare, Eiken Chemical, Hitachi
