Research Summary

Inductive position sensors are devices that use electromagnetic induction to detect the position of an object or target. These sensors operate based on the principle of inducing eddy currents in a conductive target as it moves within the sensor's electromagnetic field. The changes in the inductance caused by the movement of the target are then converted into a position signal. Inductive position sensors are known for their non-contact operation, making them suitable for applications where physical contact with the target is undesirable. They find use in various industries, including automotive, manufacturing, and automation, for tasks such as position monitoring, object detection, and precision control. The non-contact nature of inductive position sensors contributes to their durability and reliability in harsh environments, and their ability to provide accurate position feedback makes them valuable in diverse industrial applications.

The major global manufacturers of Inductive Position Sensors include Ifm Electronic, PEPPERL+FUCHS, TURCK, Omron Corporation, Eaton, Baumer, Honeywell International Inc, Schneider Electric, Rockwell Automation, Sick AG, Balluff, Panasonic

Corporation, GARLO GAVAZZI, Warner Electric (Altra), Proxitron, Fargo Controls, etc. The global players competition landscape in this report is divided into three tiers.
