### Research Summary

An infusion manifold is a medical device used in healthcare settings, particularly in intravenous (IV) therapy, to deliver multiple medications or fluids simultaneously to a patient through a single access point. The manifold consists of a central hub with multiple ports or channels connected to individual tubing lines. Each port on the manifold can be attached to IV bags containing different medications, solutions, or fluids, allowing healthcare providers to administer them concurrently without the need for separate IV access points. Infusion manifolds are designed to ensure accurate delivery rates, prevent mixing of incompatible medications, and minimize the risk of contamination during infusion therapy. They are commonly used in critical care units, operating rooms, and infusion centers where patients require multiple medications or fluids concurrently, such as in intensive care, anesthesia, and chemotherapy settings. Infusion manifolds help streamline medication administration, reduce nursing workload, and enhance patient safety in complex medical treatments requiring multiple infusions.

The major global manufacturers of Infusion Manifold include Merit Medical Systems, Smiths Medical, B.Braun, Fresenius Kabi, ICU Medical, Demax Medical, Argon Medical
