Research Summary

An ingestible temperature sensor is a small, swallowable device equipped with sensors capable of monitoring the internal body temperature of a patient. Typically encapsulated in a biocompatible material, these sensors are ingested orally and can transmit real-time temperature data wirelessly to an external receiver or a mobile device. In medical applications, ingestible temperature sensors offer a non-invasive and convenient method for continuous temperature monitoring, particularly in cases where traditional methods such as oral, axillary, or tympanic measurements may not be feasible or accurate enough. They find applications in various healthcare scenarios, including monitoring patients during surgery, tracking temperature fluctuations in individuals with fever or infections, and assessing core body temperature trends in athletes during training or competition, providing valuable insights for medical professionals to make informed decisions about patient care.

The major global manufacturers of Ingestible Temperature Sensor include Koninklijke Philips, HQ, Medtronic, BodyCap, myTemp BV, etc. The global players competition
