Research Summary

An injection mold, also known as a mold or tool, is a specially designed metal cavity used in the injection molding process to produce plastic parts. It consists of two halves, a stationary half (the cavity) and a movable half (the core), which are precision-machined to create the desired part shape. The mold is mounted onto the injection molding machine, and molten plastic material is injected into the cavity under high pressure. Once the plastic material cools and solidifies, the mold opens, and the finished part is ejected. Injection molds are typically made from hardened steel or aluminum alloys to withstand the high pressures and temperatures of the injection molding process and ensure precise part replication. They can be customized to accommodate various part geometries, surface finishes, and production volumes, making them essential tools for mass-producing plastic components across a wide range of industries.

The major global manufacturers of Injection Mould include TQM, Greatoo, Himile, Aco Mold, Tech Mold, Nypro, Ogihara, Adval Tech, Roeders, Chengfei Integration
