Research Summary

Injection and puncture devices are medical instruments designed for administering medications, fluids, or extracting bodily fluids through puncturing the skin or tissues. These devices encompass a broad range of tools, including syringes, needles, lancets, and catheters, each serving specific purposes in medical procedures. Syringes and needles are commonly used for delivering medications, vaccines, or drawing blood samples for diagnostic testing. Lancets are small, sharp blades used for making small incisions in the skin, typically for obtaining capillary blood samples or performing glucose monitoring. Catheters are flexible tubes inserted into the body to deliver fluids, medications, or to drain bodily fluids from specific locations, such as the bladder or blood vessels. Injection and puncture devices are essential tools in medical practice, facilitating various therapeutic interventions, diagnostic procedures, and patient care protocols with precision and efficiency.
