Research Summary

Injection port septa are components used in gas chromatography (GC) instruments, specifically in the injection port, to seal the port while allowing for the introduction of samples into the GC column. These septa are typically made of a flexible, resilient material such as silicone or a blend of silicone and rubber, which can withstand repeated punctures from syringe needles without deforming or leaking. Injection port septa play a crucial role in maintaining the integrity of the GC system by preventing contamination and loss of sample during injection. They come in various sizes and configurations to fit different types of injection ports and accommodate different types of samples. Additionally, some injection port septa may include features such as pre-slit or pre-pierced designs to facilitate sample introduction and reduce the risk of coring when the syringe needle pierces the septum.

The major global manufacturers of Injection Port Septa include Shimadzu, Agilent, Merck, PerkinElmer, Restek Corporation, GL Sciences Inc., Chromatography Research Supplies, Worldwide Glass Resources, Pawling Engineered Products, etc. The global

players competition landscape in this report is divided into three tiers.
