Research Summary

Insect feed refers to the use of insects, such as black soldier fly larvae, mealworms, or crickets, as a source of nutrition for animals, particularly livestock and aquaculture species. Insect feed is gaining attention as a sustainable and environmentally friendly alternative to traditional feed sources like soybeans or fishmeal, which can have significant ecological and ethical concerns associated with their production. Insects are highly efficient converters of organic matter into high-quality protein and fats, making them an attractive feed option. Additionally, insects can be reared on organic waste streams, such as food scraps or agricultural by-products, further reducing their environmental footprint. Insect-based feeds offer benefits such as reduced greenhouse gas emissions, decreased land and water usage, and potentially improved animal health and product quality. As a result, insect feed is increasingly being explored as a viable solution to address the challenges of feeding a growing global population while minimizing the impact on the planet's finite resources.

The major global manufacturers of Insect Feed include AgriProtein, Ynsect, Enterra Feed, Entofood, InnovaFeed, Enviroflight, Hexafly, HiProMine, MealFood Europe,
