### Research Summary

An insufflator is a medical device used during endoscopic procedures to inflate body cavities or organs with a gas, typically carbon dioxide (CO<sub>2</sub>), to create a clear view and adequate working space for the endoscope. The insufflator regulates the flow and pressure of the gas, ensuring controlled inflation while minimizing patient discomfort and risks associated with excessive insufflation. It is equipped with features such as pressure sensors, flow meters, and safety mechanisms to monitor and maintain optimal gas pressure and flow rates throughout the procedure. Insufflators are commonly used in laparoscopic surgeries, hysteroscopy, and arthroscopy, enabling surgeons to visualize and manipulate internal structures with precision and safety.
