Research Summary

An integrated circuit (IC) type optocoupler, also known as an opto-isolator or optocoupler IC, is a component that electrically isolates two circuits while allowing data transfer through the use of light waves. It typically consists of a light-emitting diode (LED) and a photodetector (photodiode, phototransistor, or photoSCR) housed within the same IC package. When an electrical signal is applied to the input side, the LED emits light, which is then detected by the photodetector on the output side, creating electrical isolation. Integrated circuit type optocouplers find applications in situations where it's crucial to isolate high-voltage and low-voltage sections of a circuit, providing protection against voltage spikes, noise, and enhancing safety. They are commonly used in industrial automation, power supply circuits, data communication systems, and other electronic devices where isolation is essential to prevent interference and ensure reliable operation.

The major global manufacturers of Integrated Circuit Type Optocoupler include ON
