### Research Summary

An Interbody Fusion Cage is a medical implant used in spinal surgery to stabilize and promote fusion between two adjacent vertebrae. This cage is typically made of materials like titanium or polymer and is designed in a shape that fits between the vertebral bodies. The primary purpose of an interbody fusion cage is to restore disc height, decompress neural structures, and facilitate the fusion of the vertebrae. Surgeons insert the cage into the intervertebral space, promoting bone growth through and around the device. The cage provides structural support during the fusion process and maintains proper spinal alignment. Interbody fusion cages are commonly used in procedures such as anterior lumbar interbody fusion (ALIF) or posterior lumbar interbody fusion (PLIF) to treat conditions like degenerative disc disease, disc herniation, or spinal instability.
