Research Summary

An interferometer is a precision optical instrument used to measure minute variations in the relative positions of waves. It operates based on the principles of interference, where two or more coherent waves superimpose to create an interference pattern that can be analyzed for various applications. Interferometers are widely employed in physics, optics, and engineering for tasks such as measuring distances, testing optical components, and conducting experiments in quantum mechanics. Common types of interferometers include Michelson interferometers, Fabry–Perot interferometers, and Mach–Zehnder interferometers, each with specific applications and advantages. Interferometry plays a crucial role in scientific research and metrology, providing highly accurate measurements and enabling the study of phenomena that require precise evaluation of optical properties and distances.

The major global manufacturers of Interferometer include Keysight Technologies, Renishaw, Zygo, Haag-Streit group, TOSEI Eng, OptoTech, TRIOPTICS, 4D Technology, Palomar Technologies, Kylia, Optodyne, Automated Precision, etc. The
