Research Summary

Intraoral scanners for digital impressions are advanced dental devices designed to replace traditional methods of obtaining impressions of a patient's teeth and oral structures. These scanners use optical technology to capture high-resolution, three-dimensional images of the inside of the patient's mouth. The process involves the use of a handheld wand or probe that is carefully maneuvered around the oral cavity to capture detailed images, eliminating the need for uncomfortable traditional molds or putty. The captured digital impressions are then converted into accurate 3D models, aiding in various dental procedures such as crown and bridge placements, orthodontic treatments, and restorative dentistry. Intraoral scanners enhance the precision and efficiency of treatment planning, reduce patient discomfort, and contribute to the overall digital transformation of modern dentistry.
