Research Summary

An intradermal injection device is a specialized medical instrument designed for delivering medication or vaccines into the dermis layer of the skin. Unlike traditional injections, which penetrate deeper into the muscle tissue, intradermal injections are administered directly into the shallow layer of skin between the dermis and epidermis. This method allows for more precise delivery of medications and vaccines, as well as potentially reducing the required dosage. Intradermal injection devices typically feature a fine needle or microneedle, often with a length of less than 5 millimeters, to ensure accurate placement within the skin layer. These devices may be manually operated or designed for use with injection pens or auto-injectors, depending on the specific application and user requirements. Intradermal injection devices are commonly used in healthcare settings for administering certain vaccines, allergy testing, and delivering medications such as insulin and local anesthetics.

The major global manufacturers of Intradermal Injection Device include NanoPass Technologies, Lightnix Inc, Idevax, BD, Debiotech SA, PharmaJet, Novosanis, HIPRA,

Terumo, etc. The global players competition landscape in this report is divided into three tiers.
