Research Summary

Intranasal drug delivery devices are medical devices designed for the administration of pharmaceutical substances through the nasal route. These devices enable the direct delivery of drugs to the nasal mucosa, facilitating rapid absorption into the bloodstream. Commonly used for medications such as nasal sprays and powders, intranasal drug delivery offers a non-invasive and convenient alternative to traditional oral or injectable routes. The nasal mucosa's rich blood supply allows for quick absorption, leading to faster onset of action and potentially reduced side effects. Intranasal drug delivery devices are employed in various medical applications, including the treatment of allergies, migraine headaches, and certain respiratory conditions. The devices come in different forms, such as metered-dose nasal sprays or dry powder inhalers, providing patients with effective and accessible means of receiving specific medications through the nasal passages.
