Research Summary

Intraoperative imaging refers to the use of imaging technologies during surgical procedures to provide real-time visual guidance and information to surgeons. This advanced medical imaging is performed in the operating room to enhance precision and accuracy during various surgical interventions. Intraoperative imaging techniques include fluoroscopy, ultrasound, computed tomography (CT), magnetic resonance imaging (MRI), and intraoperative angiography. These technologies enable surgeons to visualize internal structures, monitor instrument placement, and assess the progress of the surgery in real-time. Intraoperative imaging plays a crucial role in procedures such as neurosurgery, orthopedic surgery, cardiovascular surgery, and oncological interventions, allowing for more informed decision-making and improved surgical outcomes. The integration of intraoperative imaging into surgical workflows contributes to enhanced safety, reduced complications, and increased overall efficacy in complex surgical procedures.

The major global manufacturers of Intraoperative Imaging include GE, Siemens, Philips,

Medtronic, Medistim, Hitachi, Esaote, Mindray, Neurologica, ANKE, etc. The global players competition landscape in this report is divided into three tiers.
