### Research Summary

Intraoperative Monitoring (IOM) solutions are specialized medical technologies and services used during surgical procedures to monitor the function of the nervous system in real-time. These solutions aim to prevent or minimize neurological damage by continuously assessing the integrity of nerves and neural pathways during surgery. IOM typically involves the use of various techniques, including electromyography (EMG), somatosensory evoked potentials (SSEP), motor evoked potentials (MEP), and electroencephalography (EEG), among others. During surgery, electrodes are placed on specific muscles or nerves, and electrical signals are recorded and analyzed to assess the function of the nervous system. Any changes or abnormalities detected can alert the surgical team to potential nerve injury, ischemia, or other issues, allowing for prompt intervention to prevent permanent damage. Intraoperative Monitoring solutions are particularly crucial for complex surgical procedures involving the brain, spine, or peripheral nerves, as they help ensure patient safety and optimal surgical outcomes.
