Research Summary

Intraoperative Magnetic Resonance Imaging (MRI) is a specialized medical imaging technique performed during surgical procedures to provide real-time, high-resolution images of the internal structures. Unlike traditional MRI scans conducted in separate imaging suites, intraoperative MRI systems are integrated into the operating room, allowing surgeons to visualize and assess anatomical details during surgery. This technology enables immediate and accurate assessment of the surgical site, guiding surgeons in making precise decisions about tumor resection margins, verifying the placement of implants, or confirming the success of interventions. Intraoperative MRI is particularly valuable in neurosurgery and certain oncological procedures, where the ability to visualize and navigate within the complex anatomy is critical. The use of intraoperative MRI contributes to improved surgical outcomes, increased safety, and the potential for more complete and targeted tumor removal.

The major global manufacturers of Intraoperative MRI include GE, Siemens, Phillips, Medtronic, Hitachi, etc. The global players competition landscape in this report is
