### Research Summary

Intumescent coatings are specialized fire-resistant coatings applied to surfaces, such as steel structures, wood, or other building materials, to provide passive fire protection. These coatings react to heat exposure by expanding in a controlled and predictable manner, forming a thick, insulating layer that acts as a barrier against the spread of fire. The expansion creates a char layer that insulates the underlying material, retarding the transfer of heat and maintaining the structural integrity of the coated surface during a fire incident. Intumescent coatings are commonly used in construction and industrial settings, including commercial buildings, factories, and transportation infrastructure, to enhance fire safety and comply with building codes and regulations. Their ability to delay the progress of a fire allows for increased evacuation time and aids firefighting efforts, making them a crucial element in overall fire protection strategies.

The major global manufacturers of Intumescent Coatings include Sherwin-Williams, AkzoNobel, PPG, JOTUN, Nippon Paint, Etex Group, Hunan Xiangjiang Paint Group, Kansai Paint, Shandong Judong New Material, Beijing BBMG, RPM International,
