### Research Summary

Invar alloy foil is a thin sheet of material made from an alloy known as Invar. Invar is a nickel-iron alloy with a low coefficient of thermal expansion (CTE), meaning it expands and contracts very little with changes in temperature. The most common type of Invar alloy contains approximately 36% nickel and 64% iron. This specific composition gives Invar its unique properties, making it ideal for applications requiring dimensional stability over a wide temperature range. Invar alloy foil is used in various industries, including aerospace, electronics, and precision engineering, where it is used for applications such as precision instruments, thermal expansion compensators, and components requiring tight dimensional tolerances. Its low thermal expansion makes Invar foil particularly useful in applications where stability and accuracy are critical, such as in precision optical systems, semiconductor manufacturing, and aerospace structures.

The major global manufacturers of Invar Alloy Foil include Eagle Alloys, Ed Fagan, Baosteel, Columbia Metals, H. Cross Company, Magellan Industrial Trading Co., Inc., Impact Ireland (Metas) Ltd., Aperam, Reade International Corp., Rolled Alloys, City
