Research Summary

An ion exchange membrane is a selective barrier designed to facilitate the transport of ions while restricting the passage of other substances. These membranes are commonly used in processes such as ion exchange chromatography, electrodialysis, and fuel cells. In ion exchange chromatography, the membrane separates ions based on their affinity for the exchange sites on the membrane, allowing for the separation and purification of ions in a sample. Electrodialysis employs ion exchange membranes to selectively transport ions across the membrane under the influence of an electric field, facilitating the separation of different ions from a solution. In fuel cells, ion exchange membranes enable the migration of ions while preventing the mixing of fuel and oxidant. These membranes are crucial in various industrial and scientific applications where controlled ion transport is essential for processes ranging from water purification to energy conversion technologies.

The major global manufacturers of Ion Exchange Membrane include Chemours, Asahi Kasei, AGC Chemicals, Solvay, Dongyue Group Limited, etc. The global players
