Research Summary

A Jaundice Phototherapy Bed is a specialized medical device designed to treat newborns suffering from neonatal jaundice, a condition characterized by high levels of bilirubin in the blood, leading to yellowing of the skin and eyes. This bed utilizes blue light, typically in the wavelength range of 420 to 470 nanometers, to break down bilirubin in the baby's body, allowing it to be excreted more easily through urine and stool. The treatment is non-invasive and involves placing the baby under the light source, often with protective eye coverings, to ensure effective and safe reduction of bilirubin levels, thus preventing potential complications such as kernicterus, a type of brain damage.
