Research Summary

Karl Fischer titrators are laboratory instruments used for the quantitative determination of water content in various substances. Named after the chemist Karl Fischer who developed the method, these titrators employ a specific titration technique known as the Karl Fischer titration. The method involves the reaction of iodine with water, and the endpoint of the titration is determined by the complete reaction of water with iodine. Karl Fischer titrators are widely used in industries such as pharmaceuticals, petrochemicals, and food to measure and control the moisture content in raw materials, intermediates, and final products. These instruments are crucial for ensuring product quality, as water content can significantly impact the properties and stability of many materials. Karl Fischer titrators come in different configurations, including volumetric and coulometric systems, offering flexibility to suit various laboratory requirements.
