Research Summary

A knee prosthesis, also known as a knee replacement implant, is a medical device used to replace a damaged or diseased knee joint with artificial components. This surgical procedure, known as knee arthroplasty, is typically performed to relieve pain, improve mobility, and restore function in individuals with severe knee arthritis or significant knee joint damage due to injury or other conditions. The knee prosthesis consists of several components designed to replicate the natural structure and function of the knee joint. These components include the femoral component (metal component for the thigh bone), the tibial component (metal and plastic component for the shin bone), and in some cases, the patellar component (plastic component for the kneecap). The prosthetic components are usually made from durable materials such as metals (e.g., titanium, cobalt-chromium alloys) and high-density polyethylene. Modern knee prostheses are designed to provide stability, range of motion, and longevity, allowing patients to regain mobility and resume daily activities with reduced pain and improved knee function post-surgery. Physical therapy and rehabilitation are typically recommended after knee replacement surgery to help patients regain strength, flexibility, and overall knee function.

The major global manufacturers of Knee Prosthesis include Zimmer Biomet, CeramTec Group, ChunLi, AK Medical, Double Medical, Kinetic, Stryker, Smith & Nephew, Wego Group, Johnson & Johnson?Depuy?, LINK Bio Corp, Exactech, Double Medical, etc. The global players competition landscape in this report is divided into three tiers.
