Research Summary

A lacrimal duct stent system is a medical device used in ophthalmology to treat conditions affecting the tear ducts, specifically the lacrimal ducts that drain tears from the eyes into the nasal cavity. These stent systems are designed to address blockages or narrowings (stenosis) in the lacrimal drainage system, which can lead to excessive tearing (epiphora) or recurrent infections. The stent itself is a small, typically biocompatible tube or device that is surgically placed into the lacrimal ducts to keep them open and allow tears to drain properly. This procedure, known as lacrimal duct stenting or lacrimal stenting, helps restore normal tear drainage and alleviate symptoms associated with tear duct obstruction. Lacrimal duct stent systems may be temporary or permanent, depending on the specific medical condition and treatment plan recommended by ophthalmologists or oculoplastic surgeons. Proper placement and monitoring of the stent are critical to ensure optimal healing and function of the lacrimal drainage system in patients.
