Research Summary

Lacrimal stent and tube systems are medical devices designed to address issues related to tear drainage and the lacrimal drainage system. These systems are used in the treatment of conditions such as nasolacrimal duct obstruction, which can lead to excessive tearing or recurrent infections. A lacrimal stent is a small tube inserted into the lacrimal drainage system to maintain or restore its patency. Lacrimal tube systems may involve the placement of tubes in the nasolacrimal duct or canaliculi to facilitate tear drainage. These devices are often used in surgical procedures to create a passage for tears to flow from the eyes into the nasal cavity, bypassing any obstruction. Lacrimal stent and tube systems play a crucial role in improving tear drainage and relieving symptoms associated with lacrimal system disorders, contributing to the overall well-being of patients experiencing such conditions.
