Research Summary

Laminating film is a thin layer of plastic material, often composed of polyester or polypropylene, used for encapsulating and protecting documents, photos, or other printed materials. The laminating process involves sandwiching the target item between two layers of the film and then using heat and pressure to bond the layers together. This creates a sealed, transparent surface that enhances the durability, longevity, and resistance to wear and tear of the encapsulated material. Laminating film is commonly employed for preserving and protecting important documents, identification cards, posters, and educational materials. It provides a clear and glossy finish, making the laminated items more robust and resistant to damage from moisture, stains, and handling. Laminating film finds applications in various settings, including offices, schools, print shops, and other environments where document protection is essential.

The major global manufacturers of Laminating Film include COSMO, Transilwrap, DandK, Flex Film, Derprosa, GMP, IPAK, J-Film, KDX, Guangdong Eko, New Era, Wenzhou Dingxin, Yantai Hongqing, etc. The global players competition landscape in
