Research Summary

A laminator is a machine designed for the process of lamination, which involves applying a protective layer of plastic film onto documents, photos, or other materials. The laminator typically consists of rollers and a heating element enclosed in a housing. The laminating film, often composed of polyester or polypropylene, is fed into the machine along with the item to be laminated. As the materials pass through the rollers, heat is applied, causing the film to bond securely to the surface of the document. Laminators come in various sizes, catering to different lamination needs, from small office laminators for ID cards and documents to larger industrial laminators for posters and signage. They are widely used in offices, schools, print shops, and other settings where preserving and enhancing the longevity of materials is essential.

The major global manufacturers of Laminator include Aurora, Lami Corporation, Meiko Shokai, GMP, ACCO Brands, RICOH, Deli, HP, Nakabayashi, HUANDA, Irisohyama, Fellows, OHM ELECTRIC, JOL, FUJIPLA, Asmix, 3M, DOCON, Huibao, etc. The global players competition landscape in this report is divided into three tiers.
