Research Summary

Laser Capture Microdissection (LCM) is an advanced laboratory technique used in biological and medical research to precisely isolate specific cells or tissues from a heterogeneous sample under microscopic guidance. The process involves using a laser to selectively cut and capture targeted cells or regions of interest from a tissue section or a cytological sample. LCM enables researchers to isolate individual cells or specific populations without contaminating adjacent areas, preserving the integrity of the collected material for downstream molecular analysis. This technique is particularly valuable in genomics, transcriptomics, and proteomics studies, allowing for the analysis of specific cell types or disease-related regions in tissues. Laser Capture Microdissection has applications in cancer research, neuroscience, and various other fields where isolating pure cell populations is essential for obtaining accurate molecular information.

The major global suppliers of Laser Capture Microdissection include Leica Microsystems, Life Technologies, Carl Zeiss Microscopy, Molecular Machines &
