Research Summary

A Laser Direct Structuring (LDS) antenna refers to an antenna structure that is created using the Laser Direct Structuring process. LDS is a technology used in the manufacturing of three-dimensional molded interconnect devices, enabling the selective metallization of plastic parts. In the context of antennas, LDS is utilized to add conductive patterns onto plastic surfaces, creating complex and customized antenna designs. The process involves laser activation of a specialized additive in the plastic, which then attracts and binds metal plating during subsequent electroless plating steps. This allows for the integration of antennas directly onto plastic components, offering flexibility in design and reducing the need for additional metallic components. LDS antennas find applications in various industries, including automotive, consumer electronics, and telecommunications, providing a lightweight and versatile solution for incorporating antennas into plastic housings.

The major global manufacturers of Laser Direct Structuring (LDS) Antenna include
