Research Summary

LED chips are the fundamental components of LED lighting. They are small semiconductor devices that emit light when an electric current passes through them. LED chips are typically made of a small piece of semiconductor material, such as gallium nitride (GaN) or gallium arsenide (GaAs), and are packaged within a protective casing. The chip itself consists of a junction formed by different layers of semiconductor material, where electrons and electron holes combine, releasing energy in the form of light. LED chips are known for their energy efficiency, longevity, and versatility in producing different colors of light. LED modules, on the other hand, refer to the assembly of LED chips along with other components like heat sinks, optics, and drivers, into a functional lighting unit. LED modules provide a convenient and ready-to-use solution for lighting applications. They enhance the thermal management of the LED chips, provide optical control and diffusion, and integrate electronics for proper voltage regulation and control. LED modules come in various shapes, sizes, and configurations to suit different lighting requirements, making it easier for lighting manufacturers to design and implement LED lighting systems.

The major global manufacturers of LED Chip and Module include Epistar, San'an Opto, Cree, OSRAM, Samsung, Toyoda Gosei, Seoul Semiconductor, Philips Lumileds, ETI, LG Innotek, NiChia, HC SemiTek, Lextar, Lattice Power, OPTO-TECH, Tyntek, Genesis Photonics, Formosa Epitaxy, Changelight, Aucksun, TongFang, etc. The global players competition landscape in this report is divided into three tiers.
