Research Summary

Secondary optics are those optics which exist outside of the LED package, such as reflector, TIR lenses, Fresnel lenses, and pillow lenses. Secondary optics are used to create the desired appearance and beam pattern of the LED signal lamp. LEDs generally emit light at a 120-degree viewing angle. LED applications that require more focused light often use a secondary optic that is placed over the LED, which internally reflects light into a spot, medium spot, wide spot or elliptical spot pattern. Secondary optics are used to modify the output beam of the LED such that the output beam of the finished signal lamp will efficiently meet the desired photometric specification. In addition, secondary optics serve an aesthetic purpose by determining the lit and unlit appearance of the signal lamp. The primary optic is included in the LED package, and the secondary optics are part of the finished signal lamp. There are two primary categories of secondary optics used, those that spread the incoming light (diverging optics), and those that gather the incoming light into a collimated beam (collimating optics).

The major global manufacturers of LED Secondary Optic include Ledlink Optics, Carclo Optics, Auer Lighting, LEDIL Oy, FRAEN Corporation, GAGGIONE (Lednlight), Bicom Optics, Darkoo Optics, Aether systems Inc, B&M Optics Co, ShenZhen Likeda Optical, HENGLI Optical, Brightlx Limited, FORTECH, Kunrui Optical, Chun Kuang Optics, Wuxi Kinglux Glass Lens, etc. The global players competition landscape in this report is divided into three tiers.
