Research Summary

A lentiviral production system is a method used to generate lentiviral vectors, which are viral particles derived from lentiviruses like HIV and engineered to deliver genetic material into target cells. This system typically involves cloning the gene of interest into a lentiviral vector plasmid containing viral elements necessary for packaging, transfecting the plasmid into packaging cells, usually HEK293T cells, along with helper plasmids encoding viral proteins. Inside the packaging cells, the lentiviral vector plasmid is replicated and packaged into lentiviral particles. These particles are then harvested, purified, and concentrated to obtain a high-titer lentiviral vector solution. Lentiviral vectors are widely used in research for gene transfer applications, including gene therapy, gene editing, and basic research on gene function and regulation.

The major global manufacturers of Lentiviral Production System include Thermo Fisher Scientific, Oxgene, Lonza, Oxford Biomedica, AGC Biologics, GeneMedi, OriGene, Charles River, Invitria, Polyplus (Sartorius), Merck, Kerafast, CCRM, EurekaBio, GenScript ProBio, etc. The global players competition landscape in this report is divided
