### Research Summary

Linear motors are electromagnetic devices that convert electrical energy directly into linear motion without the need for any mechanical transmission elements. They are similar in concept to traditional rotary motors but are designed to provide linear motion instead of rotational motion.

Linear motors consist of a stationary stator and a movingforcer. The stator contains a series of magnets or coils that produce a magnetic field, while the forcer contains a magnet or coil that is attracted to the magnetic field. As electrical current is applied to the stator coils, it creates a magnetic field that attracts the forcer, causing it to move along the length of the stator.

Linear motors are used in a variety of applications, including high-speed transportation systems, such as maglev trains and linear motors for elevator systems, as well as in manufacturing, robotics, and other industrial applications. They offer several advantages over traditional mechanical transmission systems, including higher efficiency, faster response times, and greater precision and control.

The major global manufacturers of Linear Motors include Parker, Bosch Rexroth AG,

Moog Inc, Yaskawa Electric, Rockwell Automation Inc, HAN'S Motor, Mitsubishi, Hiwin, Tecnotion, Sanyo, Beckhoff Automation, Siemens, ETEL S.A., FANUC Corporation, Kollmorgen, Akribis Systems Pte Ltd, Sodick, PBA system, Linmot, Aerotech, Jenny Science, etc. The global players competition landscape in this report is divided into three tiers.
