Research Summary

Liquid oxygen is a pale blue, cryogenic liquid that is formed when oxygen gas is cooled to extremely low temperatures of around -183 degrees Celsius. It is highly reactive and supports combustion, making it a vital component in various industrial applications like welding and rocket propulsion. Liquid nitrogen, on the other hand, is a colorless and odorless cryogenic liquid derived from air that has been cooled to around -196 degrees Celsius. It is commonly used in cryopreservation, food freezing, and as a coolant in various industrial processes due to its low temperature and inert properties. Finally, liquid argon is a colorless and odorless cryogenic liquid that is obtained by distilling air at extremely low temperatures of around -186 degrees Celsius. It is primarily used as an inert shielding gas in welding and metalworking operations, and it also finds applications in the scientific research field, where its cryogenic properties are valuable for preserving biological samples and conducting experiments at low temperatures.
