### Research Summary

Liquid photoresist is a light-sensitive material used in the process of photolithography to transfer intricate patterns onto substrates for various manufacturing applications. Composed of polymers, solvents, and photosensitive compounds, liquid photoresist is applied as a thin coating on a substrate and then exposed to ultraviolet (UV) light through a photomask, which defines the desired pattern. The UV light causes a chemical reaction in the exposed areas, altering the solubility of the resist. Subsequently, the unexposed areas are removed by rinsing with an appropriate developer solution, leaving behind the desired patterned resist on the substrate surface, which can then be further processed for subsequent manufacturing steps such as etching or deposition. Liquid photoresists offer versatility, allowing for high-resolution patterning and enabling the fabrication of intricate microstructures in fields like semiconductor manufacturing, electronics, and microfabrication.

The major global manufacturers of Liquid Photoresist include DuPont, Fujifilm Electronic Materials, Tokyo Ohka Kogyo, Merck Group, JSR Corporation, LG Chem, Shin-Etsu

Chemical, Sumitomo, Chimei, Daxin, Everlight Chemical, Dongjin Semichem, Great Eastern Resins Industrial, Chang Chun Group, etc. The global players competition landscape in this report is divided into three tiers.
