Research Summary

A lithium battery cathode binder is a crucial component used in the fabrication of lithium-ion battery electrodes. The binder serves to hold together the active materials (such as lithium metal oxides) and conductive additives within the cathode structure, ensuring good adhesion to the current collector and facilitating efficient electron and ion transport during battery operation. Commonly used binders include polyvinylidene fluoride (PVDF), carboxymethyl cellulose (CMC), and styrene-butadiene rubber (SBR), among others. The choice of binder can significantly impact the performance and durability of the battery, influencing parameters such as electrode porosity, conductivity, and mechanical stability. Researchers continuously seek to develop new binder materials and formulations to enhance the energy density, cycle life, and safety of lithium-ion batteries for various applications, including electric vehicles, portable electronics, and grid storage systems.

The major global manufacturers of Lithium Battery Cathode Binder include Kureha, Arkema, Solvay, Zhejiang Fluorine Chemical, Sinochem Lantian, Shandong Huaxia
