Research Summary

Load cells are transducers used to measure and convert applied force or weight into an electrical signal. They are commonly employed in various industrial and scientific applications for weighing, force measurement, and control systems. Load cells typically consist of a metal body with strain gauges or piezoelectric sensors mounted on it. When a force or weight is applied to the load cell, it deforms, creating strain or stress on the gauges. The strain gauges or piezoelectric sensors detect this deformation and convert it into an electrical signal, usually in the form of voltage or current, which is proportional to the applied force. Load cells are available in different types, such as compression, tension, shear, and bending, to accommodate different load configurations. They are widely used in fields such as manufacturing, aerospace, automotive, material testing, and healthcare, providing accurate and reliable measurements for weight, force, and load monitoring systems.

The major global manufacturers of Load Cells include ZEMIC, Spectris, Vishay Precision Group, Mettler Toledo, MinebeaMitsumi Inc., Keli Electric Manufacturing (Ningbo), A&D, Measurement Specialists and National Scale Technology, PCB
