Research Summary

Long life milk, also known as UHT (Ultra High Temperature) milk or shelf-stable milk, is a type of dairy milk that has undergone a specific pasteurization process to extend its shelf life. The milk is heated to a very high temperature for a short period of time, typically around 135 to 150 degrees Celsius (275 to 302 degrees Fahrenheit), which kills off bacteria and microorganisms that cause spoilage. This UHT process allows the milk to be stored at room temperature for an extended period, typically ranging from several months to a year, without the need for refrigeration until the package is opened. The aseptic packaging used for long life milk is specially designed to maintain the quality and safety of the milk, preventing contamination and keeping it fresh. Long life milk offers convenience and flexibility in terms of storage and transportation, making it popular in areas where refrigeration facilities may be limited or during travel. It is important to note that once opened, long life milk should be refrigerated and consumed within a few days, just like regular fresh milk.
