Research Summary

Loop Electrosurgical Excision Procedure (LEEP) is a medical procedure used to remove abnormal or precancerous tissue from the cervix, typically as part of the treatment for cervical dysplasia or to diagnose cervical cancer. During the procedure, a thin wire loop, heated by an electrical current, is used to excise or ?cut? the abnormal tissue. LEEP is commonly performed after abnormal Pap smear results or a positive human papillomavirus (HPV) test to prevent the progression of cervical cancer. It is typically done in a doctor's office or clinic under local anesthesia and is known for being minimally invasive, with a relatively short recovery time and a high success rate in treating precancerous lesions.
