### Research Summary

LoRa chipsets refer to integrated circuits designed to enable long-range, low-power wireless communication using the LoRa (Long Range) protocol. LoRa is a modulation technique and network protocol specifically developed for Internet of Things (IoT) applications. LoRa chipsets typically consist of a radio transceiver, a microcontroller, and other necessary components for communication and data processing. These chipsets provide the foundation for LoRa-based devices, enabling them to transmit and receive data over long distances while consuming minimal power. They operate in unlicensed frequency bands and can achieve ranges of several kilometers in open environments. LoRa chipsets are commonly used in various IoT applications, including smart cities, industrial monitoring, agriculture, asset tracking, and environmental sensing. They offer a cost-effective and energy-efficient solution for connecting numerous devices in a wide area network, allowing for the collection and transmission of data from sensors or devices to a central hub or cloud platform.

The major global manufacturers of LoRa Chipsets include Semtech, ASR

Microelectronics, STMicroelectronics, etc. The global players competition landscape in this report is divided into three tiers.
