### Research Summary

Louvers and dampers are devices used in ventilation and air control systems to regulate airflow and temperature within a space. Louvers are typically slatted structures that allow air to pass through while blocking direct sunlight and rain, making them ideal for controlling natural ventilation in buildings. Dampers, on the other hand, are movable panels that can open or close to adjust the flow of air in ducts, helping to manage heating, cooling, and overall air circulation in HVAC systems. Together, these components enhance energy efficiency, improve indoor air quality, and provide comfort in various environments.
