Research Summary

Low dielectric resin refers to a type of resin that exhibits a low dielectric constant, also known as relative permittivity. Dielectric constant is a measure of a material's ability to store electrical energy in an electric field. Low dielectric resin is designed to have a reduced dielectric constant, which means it has a lower ability to store electrical energy compared to standard resins. This characteristic makes low dielectric resin ideal for applications where minimizing signal loss, crosstalk, and capacitance is critical, particularly in high-frequency and high-speed electronic systems. By using low dielectric resin as a substrate or insulation material, designers can improve the performance of printed circuit boards (PCBs), integrated circuits (ICs), and other electronic components by reducing signal distortions and losses. It enables more efficient signal propagation, lower transmission line losses, and improved electrical performance. Additionally, low dielectric resin can contribute to miniaturization, higher data transmission rates, and overall improved signal integrity in electronic devices.

The major global manufacturers of Low Dielectric Resin include SABIC, Asahi Kasei,

Zeon, DIC, Mitsubishi, Hitachi Chemical, DuPont, Lonza, Chemours, Huntsman, etc. The global players competition landscape in this report is divided into three tiers.
