Research Summary

Low melting fiber refers to a type of synthetic fiber that has a significantly lower melting point compared to traditional fibers. These fibers are designed to melt at lower temperatures, typically between 80 to 200 degrees Celsius, which makes them advantageous in various manufacturing and processing applications. Low melting fibers are commonly used in nonwoven fabrics, textiles, composite materials, and other applications where bonding or joining of materials is required. When exposed to heat, the low melting fibers soften and fuse together, creating a strong bond between different layers or components. This property allows for easy processing and enables the creation of complex structures without the need for high-temperature processes. Low melting fibers are especially useful in applications where delicate or heat-sensitive materials are involved, as they provide a gentle and efficient bonding method. Additionally, these fibers can be blended with other fibers to achieve desired characteristics and performance properties, making them versatile in a wide range of industries such as automotive, construction, healthcare, and filtration.

The major global manufacturers of Low Melting Fiber include Huvis, Toray Advanced Materials Korea, Far Eastern New Century, Nan Ya Plastics, XiangLu Chemical Fibers, Ningbo Dafa, Yangzhou Tianfulong, Taekwang, IFG Exelto NV, Hickory Springs, Dividan, Sinopec Yizheng Chemical Fibre, CNV Corporation, Shyam Fibers, ECER, Xiamen Xiangyuxinghong Technologies, etc. The global players competition landscape in this report is divided into three tiers.
