Research Summary

Low-pressure molding molds are specialized tools used in the low-pressure molding process, also known as overmolding or insert molding. This molding technique involves encapsulating delicate electronic components, connectors, or cables with a protective thermoplastic material by applying low pressure and temperature. The molds used in low-pressure molding are typically made of high-quality materials such as silicone or other heat-resistant polymers. They are designed with cavities and channels that precisely accommodate the components to be encapsulated. The molten thermoplastic material is injected into the mold at a low pressure, usually below 500 psi, and allowed to cool and solidify. The low-pressure molding process provides several advantages, including reduced stress on delicate components, excellent sealing and strain relief, and improved resistance to moisture, dust, and vibration. Low-pressure molding molds play a crucial role in achieving accurate and reliable encapsulation of sensitive components, resulting in enhanced product performance and durability.
