### Research Summary

A Low Pressure Split-core Current Transformer is a type of current transformer that is designed to measure and monitor electrical currents in a low-pressure environment. Current transformers are used in electrical systems to step down high currents to a lower, more manageable level that can be safely measured by instruments or devices. The split-core design refers to the construction of the current transformer, where the core of the transformer can be separated by opening or splitting it. This design allows for easy installation around existing conductors without the need to disconnect the current-carrying conductor. The low-pressure aspect of the transformer indicates that it is specifically designed to operate in environments where the pressure levels are low, such as residential or commercial electrical systems. These transformers are typically used for various applications, including power monitoring, energy management, load profiling, and electrical protection. They provide accurate current measurement and are known for their ease of installation and maintenance.
