Research Summary

Low sodium high temperature alumina, also known as low Na-HT (Na represents sodium), refers to a type of alumina ceramic material that possesses low levels of sodium impurities and exhibits excellent performance at high temperatures. Alumina, or aluminum oxide (Al_2O_3), is a widely used ceramic material due to its high strength, hardness, and thermal stability. In low sodium high temperature alumina, the sodium content is minimized to enhance its properties, particularly in high-temperature applications. The reduction of sodium impurities helps prevent the formation of undesirable reactions, such as the volatilization of sodium compounds at elevated temperatures, which can lead to defects or degradation of the material. Low sodium high temperature alumina finds applications in various industries, including aerospace, electronics, and industrial processes, where its exceptional thermal, mechanical, and electrical properties make it suitable for demanding environments and high-temperature operations.

The major global manufacturers of Low Sodium High Temperature Alumina include Almatris, Alteo, CHALCO, Sumitomo Chemical, Hindalco, Showa Denko, Nippon Light Metal, Shandong Aopeng, Zibo Zhengze Aluminum, Hangzhou Zhi Hua Jie Technology, etc. The global players competition landscape in this report is divided into three tiers.
